 Companies

 Hint

Given two strings `text1` and `text2`, return *the length of their longest **common subsequence***. If there is no **common subsequence**, return 0.

A **subsequence** of a string is a new string generated from the original string with some characters (can be none) deleted without changing the order of the remaining characters.

- For example, "ace" is a subsequence of "abcde".

A **common subsequence** of two strings is a subsequence that is common to both strings.

Example 1:

Input: `text1 = "abcde", text2 = "ace"`
Output: 3
Explanation: The longest common subsequence is "ace" and its length is 3.

Example 2:

Input: `text1 = "abc", text2 = "abc"`
Output: 3
Explanation: The longest common subsequence is "abc" and its length is 3.

Example 3:

Input: `text1 = "abc", text2 = "def"`
Output: 0
Explanation: There is no such common subsequence, so the result is 0.

Constraints:

- `1 <= text1.length, text2.length <= 1000`
- `text1` and `text2` consist of only lowercase English characters.
