

57. Insert Interval

Medium 🔖 Topics 🏢 Companies

You are given an array of non-overlapping intervals `intervals` where `intervals[i] = [starti, endi]` represent the start and the end of the *i*-th interval. You are also given an interval `newInterval`. Insert `newInterval` into `intervals` such that `intervals` is still sorted in ascending order by `starti` and `intervals` still does not have any overlapping intervals (merge overlapping intervals if necessary). Return `intervals` *after the insertion*.

Example 1:

Input: `intervals = [[1,3],[6,9]]`, `newInterval = [2,5]`
Output: `[[1,5],[6,9]]`

Example 2:

Input: `intervals = [[1,2],[3,5],[6,7],[8,10],[12,16]]`, `newInterval = [4,8]`
Output: `[[1,2],[3,10],[12,16]]`
Explanation: Because the new interval `[4,8]` overlaps with `[3,5]`, `[6,7]`, `[8,10]`.

Constraints:

- `0 <= intervals.length <= 104`
- `intervals[i].length == 2`
- `0 <= starti <= endi <= 105`
- `intervals` is sorted by `starti` in **ascending** order.
- `newInterval.length == 2`
- `0 <= start <= end <= 105`
